Course Notes Advanced SWAT: creating SWAT-CUP input simplified

Willem Vervoort 27-09-2017

Introduction

This is an introduction into developing SWAT CUP inout files using R, written for the "How do I use satellite and global reanalysis data for hydrological simulations in SWAT?" workshop in Montevideo between 7 - 11 August 2017, jointly organised by the University of Sydney, IRI (the University of Columbia) and INIA, Uruguay.

Functions to prepare SWAT-CUP files for the calibration and validation routine

This file demonstrates the use of two auxillary functions to create input data for SWAT calibration in SWAT-CUP, which can be called by using:

```
source("functions/SWATCUPfunctions.R")
```

There are 2 functions.

- MODIS_ts() to transform the MODIS data to a timeseries, we have seen this function already in the calibration of the rainfall runoff model. Here we use the same function.
- swatcup Efformat() the function that generates the different files depending on the inputs given.

MODIS ts

This function reads the directory indicated by *MODISdir* and looks for files with the extension pattern given by *patt*. The output is a timeseries of values stacked for all the points that are available. There are 5 columns in the output:

- Year
- JDay (Julian Day)
- value (of actual ET in mm)
- Point (a number in the catchment)
- Date (the actual date in Y-m-d)

```
# demonstrate
# Create a single file with all the MODIS ET data for all points
ET_Data <- MODIS_ts("MODIS/SantaLucia")
# show the data
head(ET_Data)</pre>
```

```
ET Point
##
     Year JDay
                                 Date
                         1 2000-01-01
## 1 2000
             1 16.2
## 2 2000
             9 22.0
                         1 2000-01-09
## 3 2000
            17 19.6
                         1 2000-01-17
## 4 2000
            25 25.1
                         1 2000-01-25
## 5 2000
            33 26.0
                         1 2000-02-02
## 6 2000
            41 24.7
                         1 2000-02-10
```

swatcup_ETformat

This function encapsulates a few separate functions and uses them to write the input files for SWAT-CUP in the right format for both ET and flow data. It can write:

- observed.txt
- \bullet observed_sub.txt
- observed rch.txt

This function takes the following input

- df, this is a data frame with flow data or ET data, the output of MODIS_ts()
- df flow this is an optional dataframe with flow data if df is ET data
- date.format is a definition of the date format in case the date format in the flow data is incorrect
- st.date: the starting date for the output
- end.date: the end date for the output
- outfile: the SWAT-CUP file you want to write
- infile: the SWAT-CUP file you use as template
- nlines: the number of lines in the header
- Flow: a boolean indicating whether or not flow data is included
- weight: a single number or a vector indicating the weight of the flow data relative to the other input data. The objective function weights will be $weight * flow + \sum weight/np * Obs_i$

```
# Demonstrate: writing files for 2008 - 2011
# read in flow data
flowdata <- readRDS(file="data/SantaLucia.RDS")</pre>
head(flowdata)
##
           Date flow
## 1 1983-03-16 3.964
## 2 1983-03-17 4.786
## 3 1983-03-18 6.226
## 4 1983-03-19 6.307
## 5 1983-03-20 5.788
## 6 1983-03-21 5.607
# original Q is in m^3/sec
# SWAT needs cumecs
# write observed_sub.txt
swatcup_ETformat(ET_Data, df_flow = NULL, date.format = "%Y-%m-%d",
                             "2008-01-01", "2011-12-31",
                 "data/observed_sub.txt" ,
                 "data/observed_sub.txt", 6, weight= 0.1)
# write observed.txt
swatcup_ETformat(ET_Data, df_flow = flowdata,
                 date.format = "%Y-%m-%d",
                 "2006-01-01", "2011-12-31",
                 "data/observed.txt" ,
                 "data/observed.txt", 14, Flow = TRUE,
                 weight = 0.1)
# write observed_rch.txt
swatcup_ETformat(flowdata,df_flow=NULL,
                 date.format = "%Y-%m-%d",
                 "2008-01-01", "2011-12-31",
                 "data/observed_rch.txt" ,
                 "data/observed_rch.txt", 6,
                 Flow = TRUE)
# Now test putting in weights relative to the size of the subcatchment
subbasin_data <- read.csv("data/subbasins_SantaLucia_alldata.csv")</pre>
```
